Advantages FRAME CONSTRUCTION

DURABILITY AND FIRE RESISTANCE

The steel frame of the house ensures reliability and long service life. Galvanization ensures high corrosion resistance of the steel; insects and mold do not grow in it, in addition, steel is a non-flammable material and prevents the spread of fire.

CONFIDENCE IN QUALITY

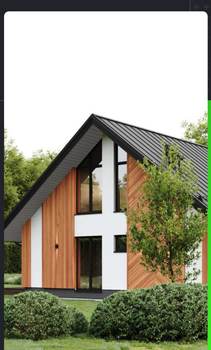
The structure of the house is almost entirely manufactured in a factory. This guarantees the accuracy of the design and, as a result, the absence of extraneous noise, drafts, mold or odors and other inconveniences throughout the entire service life.

ENERGY EFFICIENCY

Monolithic foam concrete in combination with modern energy-saving materials provides warmth and comfort in accordance with international energy efficiency classes, allowing for a comfortable temperature regime at lower costs.

SECURITY GUARANTEE

The radiological, sanitary and epidemiological safety of all building materials is confirmed by appropriate certificates. The high strength of the structure allows it to be used even in earthquake-prone regions.

RESPONSIBLE ATTITUDE TOWARDS THE ENVIRONMENT


Steel is the most environmentally friendly building material because it is completely recyclable. Choosing a galvanized metal frame is your opportunity to contribute to a greener future for your children.
